Mohankumar.M2@cognizant.com

I'm a technology professional who loves building meaningful digital experiences. Currently working as an associate, I have hands-on experience across the full web development cycle – from designing intuitive interfaces to writing clean, maintainable code and ensuring quality through thorough testing. My core strengths are web design and development, frontend engineering, and test automation using Playwright with TypeScript. I enjoy solving real-world problems and believe great software comes from a mix of creativity, discipline, and collaboration. I'm now looking for an opportunity where I can apply my skills, grow alongside talented peers, and make a real impact from day one.

Work Experience

Other Experience

Identify New Bikes(Testing automation project) Testing - 0 Month (Feb-2026 - Feb 2026)

Project Description

An automation suite designed to extract real-time automotive data and validate UI security resilience. Core Capabilities: *Two-Wheeler Tracking: Automates the discovery of upcoming Honda bikes in India priced under 4 Lac INR, capturing names, costs, and launch dates. *Market Analysis: Extracts structured data on popular pre-owned car models in Chennai. *Security Testing: Simulates a Google Login flow with invalid credentials to test UI resilience and capture error responses. *Technical Framework: Navigates complex web architectures, including dynamic frames, multiple windows, and form interactions.

Roles & Responsibilities

*Automated Testing: Designed modular scripts using Playwright & TypeScript to validate vehicle data and market listings. *Complex UI Navigation: Handled dynamic frames, nested iframes, multiple windows, and asynchronous pop-ups. *CI/CD Integration: Automated script execution within Jenkins pipelines for continuous testing and rapid feedback. *Framework Architecture: Maintained long-term script stability using the Page Object Model (POM) pattern. *Bug Reporting: Analyzed HTML reports, failure logs, and screenshots to isolate UI and data defects. *Collaboration: Partnered with cross-functional teams to define testing rules and conducted code reviews.

HR onboarding Portal(Development project) Developer - 0 Month (Jun-2026 - Jun 2026)

Project Description

Cognizant Employee Onboarding Portal – a demo web app showing AI-agent-driven onboarding. *Frontend: React + Vite UI – sign in, import/add hires, edit & select candidates, onboard them (sends welcome emails), a dashboard, and an offline "Onboarding Agent" chatbot. *Backend: tiny zero-dependency Java server that runs the onboarding agent – it reasons per hire, picks the right steps, retrieves matching policy, adapts (contractor/EU/intern), and flags compliance. Logic is simulated (no real LLM) so the demo never flakes. *In one line: an offline HR onboarding portal where an AI-style agent personalizes each new hire's setup.

Roles & Responsibilities

Role: Full-Stack Developer – HR Onboarding Portal (AI-Agent Demo) Responsibilities: *Built the React + Vite frontend – auth, candidate import/edit, onboarding flow, dashboard, and the offline "Onboarding Agent" chatbot. *Developed the zero-dependency Java REST backend and the rule-based onboarding agent (reasoning, policy RAG, compliance flags, retry logic). *Implemented CSV-based persistence, EmailJS welcome-email integration (mock/live), and roster edit/save features. *Handled testing, debugging, and documentation (README, talk cue sheet).

Career Highlights

Successfully Graduated from Cognizant Academy and Looking forward to work in the real-time challenging environment .
